Name: _____

Chemistry 150   **Exam 4**

Be sure to put your name on each page. This page can be removed from your exam so that you will have a Periodic Table handy throughout the exam, it does not need to be turned in. Show all your work for problems which require any sort of calculation, no credit will be given for answers without work shown. If you have shown a significant amount of work or multiple drawings for a problem, draw a box around what you consider your final answer.

Avogadro's Number = 6.022×10^{23} $^{units}/_{mol}$

$32.00^{\circ}F = 0.000^{\circ}C = 273.15K$

1 foot = 12 inches

1 inch = 2.54cm (exactly)

1 pound = 453.6 g = 16 ounces

1 amu = 1.6605×10^{-24} g

Masses of subatomic particles:

   Proton   1.00728amu = 1.6726×10^{-24} g

   Neutron 1.00866amu = 1.6749×10^{-24} g

   Electron 0.000549amu = 9.1094×10^{-28} g

Density of Water = $1.000^{g}/_{mL}$

R = 0.08206 $^{L \cdot atm}/_{mol \cdot K}$

PV=nRT

1 calorie = 4.184 J = 0.001Calorie

h = 6.626×10^{-34} Jsec

$\lambda = {}^{h}/_{mv}$

1 J = 1 kg $(^{m}/_{sec})^2$

$c = \lambda \nu = 3.00 \times 10^{8}$ $^{m}/_{sec}$

$E_{photon} = h\nu$

Score

Multiple Choice: Circle the letter of the most correct response. (5pts. per question)

1. A covalent bond:
   a. **Involves sharing electrons**
   b. Is always polar
   c. Forms ions in solution
   d. Always contains a metal
   e. Always has high bond energy

2. Electronegativity
   a. Is the negative charge of an ion
   b. Is the energy required to remove an electron from an atom in the gas phase
   c. Is the energy required to remove a *pair* of electrons from an atom
   d. **Is a measure of how strongly an atom attracts electrons in a covalent bond**
   e. Is determined by assigning one electron to each atom of a bond

3. Electronegativity *decreases*:
   a. In the center of the Periodic Table
   b. As the quantum number "n" decreases
   c. **Top to bottom on the Periodic Table**
   d. Left to right across the Periodic Table
   e. As atoms get smaller

4. What orbital hybridization gives a *square planar molecular shape*?
   a. sp
   b. sp^2
   c. sp^3
   d. sp^3d
   e. **sp^3d^2**

Periodic Trends: For each of the following, circle the letter of the most correct response (4pts) and give a *brief* explanation of your choice (3pts).

5. Which of the following X-O bonds would you expect to be the ***longest***?
   a. CO_2
   b. SO_2
   c. **BrO_2^-**
   d. SiO_2
   e. O_2

   > *Explain:* Bromine is the largest of the atoms bound to oxygen in this problem, so the Br-O bond is the longest

6. Which of the following *atoms* would you expect to be the ***largest***?
   a. **Sn**
   b. Be
   c. Cr
   d. K
   e. N

   > *Explain:* Tin has the most electron shells (lowest row in the Periodic Table) so it should be the largest atom of those listed.

Score

7. Which of the following *ions* would you expect to be the **largest**?
   a. Mg^{2+}
   b. P^{3-}
   c. Al^{3+}
   d. Cl^-
   e. K^+

   Explain: P^{3-}, Cl^-, and K^+ all have the same number of electrons, but P^{3-} has the fewest positively charged protons in the nucleus to attract those electrons, so the will be able to stray farther from the nucleus than in Cl^- or K^+

8. Which of the following would you expect to have the **highest** first ionization energy?
   a. Na
   b. Mg
   c. Si
   d. P
   e. Ar

   Explain: Argon has a full outer shell of electrons (it's a noble gas), so it will require a very large amount of energy to remove an electron from this very stable structure.

9. Which of the following would you expect to have the **least polar** bonds?
   a. CO_3^{2-}
   b. CN^-
   c. F_2
   d. GeS_2
   e. $TeBr_6$

   Explain: Bond polarity is a function of the difference in electronegativity between the 2 atoms that make up the bond. Since there is no difference in the electronegativity of two fluorines, this bond is pure covalent and not polar at all.

Problems:

For each of the following, write out a correct electron configuration. You may use noble gas shorthand notation for species below the 2nd row of the Periodic Table. (6pts each)
10. Sodium, Na (At.# = 11)
    $1s^2 2s^2 2p^6 3s^1$ or $[Ne]3s^1$

11. Zirconium, Zr (At.# = 40)
    $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^{10} 4p^6 5s^2 4d^2$ or $[Kr]5s^2 4d^2$
12. Selenide ion, Se^{2-} (At.# = 34)
    $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^{10} 4p^6$ or $[Ar] 4s^2 3d^{10} 4p^6$ or $[Kr]$

13. Tin(II) ion, Sn^{2+} (At.# = 50)
    $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^{10} 4p^6 5s^2 4d^{10}$ or $[Kr]5s^2 4d^{10}$

14. What are the 3 most likely charges (+ or -) of an arsenic (As, At.# = 33) ion? Explain your answers. (15pts)

   -3 $\rightarrow$ this will result in a full shell configuration, [Kr]
   +3 $\rightarrow$ this will empty the 4p subshell and leave the 4s and 3d subshells full
   +5 $\rightarrow$ this will empty the 4p and 4s subshells, leaving all the n=3 subshells full.

Score

For each of the following, draw a correct Lewis Structure, determine the formal charge on each atom, name the electronic geometry, draw an appropriate VSEPR structure, and show the dipole moment of any polar molecules/ions. (14pts each)
15. CH_3F
Formal charge on all atoms is zero
Electronic shape = Tetrahedron/tetrahedral
Molecular shape = Tetrahedron/tetrahedral
Molecule is polar, dipole points along the C-F bond
16. CHO_2^- (formate ion)

Formal charge on H, C, and the double bonded O is zero,
the FC on the single bonded O is -1
Electronic shape = trigonal planar
Molecular shape = trigonal planar
Molecule is polar, dipole points along the H-C bond

17. C_2H_2

H—C≡C—H
Formal charge on all atoms is zero.
Electronic shape = linear at each carbon
Molecular shape = linear
Molecule is non-polar.

18. PCl_5

Formal charge on all atoms is zero.
Electronic shape = trigonal bipyramidal
Molecular shape = trigonal bipyramidal
Molecule is non-polar.
