

# Chemistry 150

# Exam 3

Be sure to put your name on each page. This page can be removed from your exam so that you will have a Periodic Table handy throughout the exam, it does not need to be turned in. Show all your work for non-multiple choice problems which require any sort of calculation, no credit will be given for answers without work shown. If you have shown a significant amount of work or multiple drawings for a problem, draw a box around what you consider your final answer.

Avogadro's Number =  $6.022 \times 10^{23}$  units/mol

$h = 6.626 \times 10^{-34}$  Jsec

$32.00^\circ\text{F} = 0.000^\circ\text{C} = 273.15\text{K}$

$\lambda = h/mv$

1 foot = 12 inches

1 J = 1 kg (m/sec)<sup>2</sup>

1 inch = 2.54cm (exactly)

$c = \lambda\nu = 3.00 \times 10^8$  m/sec

1 pound = 453.6 g = 16 ounces

$E_{\text{photon}} = h\nu$

1 amu =  $1.6605 \times 10^{-24}$  g

Masses of subatomic particles:

Proton  $1.00728\text{amu} = 1.6726 \times 10^{-24}$  g

Neutron  $1.00866\text{amu} = 1.6749 \times 10^{-24}$  g

Electron  $0.000549\text{amu} = 9.1094 \times 10^{-28}$  g

Density of Water =  $1.000^{\text{g}}/\text{mL}$

$R = 0.08206$  L $\cdot$ atm/mol $\cdot$ K

$PV = nRT$

1 calorie = 4.184 J = 0.001 Calorie

**Multiple Choice:** Circle the letter of the most correct response. (5pts. per question)

- The First Law of Thermodynamics states that:
  - Kinetic energy is stored in chemical bonds
  - Electrostatic energy is another name for electricity
  - An element in its “standard” state has no energy
  - Energy cannot be created or destroyed**
  - Potential energy is a measure of the speed of molecular movement
- The specific heat capacity of any substance is:
  - The amount of energy required to increase the temperature of one mole of the substance 1°C
  - The amount of energy required to increase the temperature of one gram of the substance 1°C**
  - 4.184 J/g·°C
  - The amount of energy required to increase the temperature of one pound of the substance 1°C
  - The amount of energy required to increase the temperature of one gram of the substance 1°F
- Each of the following describes an *endothermic* process *except*:
  - Chemical bonds are broken
  - The reactants have a lower energy than the products of a reaction
  - The system absorbs heat from the surroundings
  - $\Delta H$  is positive
  - The system liberates heat to the surroundings**

**Problems:**

4. The specific heat capacity of wood is 1.76 J/g·°C. How much energy is needed to heat 450.0g of wood from 9.61°C to 39.19°C? (15pts)

$$q = (1.76 \text{ J/g}\cdot\text{°C})(450.0\text{g})(39.19-9.61\text{°C}) = 2.34 \times 10^4 \text{ J}$$

Answer 4:

5. How much energy is released when 800.0g of acetone is frozen at its freezing point (-94°C)? ( $\Delta H^\circ_{\text{fusion}} = 5.691 \text{ kJ/mol}$  for acetone) (15pts)

$$E = (5.691 \text{ kJ/mol})(1\text{mol} / 58.079\text{g})(800.0\text{g}) = 78.39\text{kJ}$$

Answer 5:

6. You have determined that  $\Delta H^\circ_{\text{reaction}}$  for the reaction of copper(II) ions with ammonia is  $-28.16 \text{ kJ/mol}$ .
- $$\text{Cu}^{2+}(\text{aq}) + 4 \text{NH}_3(\text{aq}) \rightarrow [\text{Cu}(\text{NH}_3)_4]^{+2}(\text{aq})$$

What is  $\Delta H^\circ_{\text{reaction}}$  for the following reaction? Explain your answer. (15pts)

Reverse and double  $\rightarrow +56.32 \text{ kJ/mol}$

7. One potential source of hydrogen gas for use as a fuel is water by the following reaction:

What is  $\Delta H^\circ_{\text{reaction}}$  for this process?  $\{\Delta H_f^\circ = -285.83 \text{ kJ/mol}$  for  $2 \text{H}_2\text{O}(\text{l})\}$  How many kJ of energy must be transferred to produce 15.00g of  $\text{H}_2(\text{g})$ ? Is the energy transferred *in* or *out* of the system? Explain. (20pts)

$$\Delta H_{\text{rxn}} = +571.66 \text{ kJ/mol}$$

$$(15.00 \text{g H}_2(\text{g})) (1 \text{mol H}_2 / 2.016 \text{g H}_2) (1 \text{mol rxn} / 2 \text{mol H}_2) (571.66 \text{ kJ/mol}) = 2126.7 \text{kJ in}$$

8. You have been studying a series of reactions:

So far, you have determined the following  $\Delta H^\circ_{\text{rxn}}$  values:

What is  $\Delta H^\circ_{\text{rxn}}$  for the the third step,  $\text{C} \rightarrow \text{D}$ ? Is  $\text{C} \rightarrow \text{D}$  endothermic or exothermic? Draw a qualitatively correct reaction coordinate diagram for the entire stepwise process,  $\text{A} \rightarrow \text{B} \rightarrow \text{C} \rightarrow \text{D}$ . (20pts)

$$(+8.13 \text{ kJ/mol}) = (+13.38 \text{ kJ/mol}) + (-19.61 \text{ kJ/mol}) + (\Delta H^\circ \{\text{C} \rightarrow \text{D}\})$$

$$\Delta H^\circ \{\text{C} \rightarrow \text{D}\} = +14.36 \text{ kJ/mol}$$

Fall 2011

9. You have burned 25.00g of ethane gas {C<sub>2</sub>H<sub>6</sub>(g)} in excess oxygen to produce carbon dioxide and water. If all of the energy from this reaction is transferred to a 41.93kg block of copper initially at 6.38°C, what is the final temperature of the copper block? (The specific heat capacity of Cu(s) is 0.385<sup>J</sup>/g°C ) (25pts)

Material	ΔH <sub>f</sub> <sup>o</sup> (kJ/mol)
C <sub>2</sub> H <sub>6</sub> (g)	-84.68
CO <sub>2</sub> (g)	-393.509
H <sub>2</sub> O(g)	-241.818

$$2(84.68) + 4(-393.509) + 6(-241.818) = -2855.58 \text{ kJ/mol}$$

$$(25.00\text{g})(1\text{mol ethane} / 30.069\text{g}) (1\text{mol rxn} / 2\text{mol ethane}) (2855.58 \text{ kJ/mol}) = 1187\text{kJ}$$

$$1187\text{kJ} = (0.000385)(41930\text{g})(\Delta T)$$

$$\Delta T = 73.53^\circ\text{C}$$

$$T_{\text{final}} = 6.38 + 73.53 = 79.91^\circ\text{C}$$

10. You have reacted 5.123L of oxygen at 36.19°C and 0.912atm with 250.0mL of 0.724M sodium thiocyanate solution by the following reaction:

How much heat is transferred by this reaction? Is the reaction endothermic or exothermic? (25pts)

Material	ΔH <sub>f</sub> <sup>o</sup> (kJ/mol)
Na <sup>+</sup> (aq)	-240.12
SCN <sup>-</sup> (aq)	-22.92
CN <sup>-</sup> (aq)	-183.62
SO <sub>3</sub> (g)	-395.72

$$2(+22.92) + 2(-183.62) + 2(-395.72) = -1112.84 \text{ kJ/mol}$$

Exothermic

$$\{(5.123\text{L})(0.912\text{atm}) / (0.08206)(309.34\text{K})\} (1\text{mol rxn} / 3\text{mol O}_2) (1112.84 \text{ kJ/mol}) = 68.3\text{kJ heat released}$$

$$\{(0.2500\text{L})(0.724\text{mols SCN}^- / \text{L})\} (1\text{mol rxn} / 2\text{mol SCN}^-) (1112.84 \text{ kJ/mol}) = 101 \text{ kJ heat released}$$

Oxygen is limiting, 68.3kJ heat released
